NSF /ANSI 61
LINK-SEAL® Model S61™ Provides the Solution

What is NSF/ANSI 61?

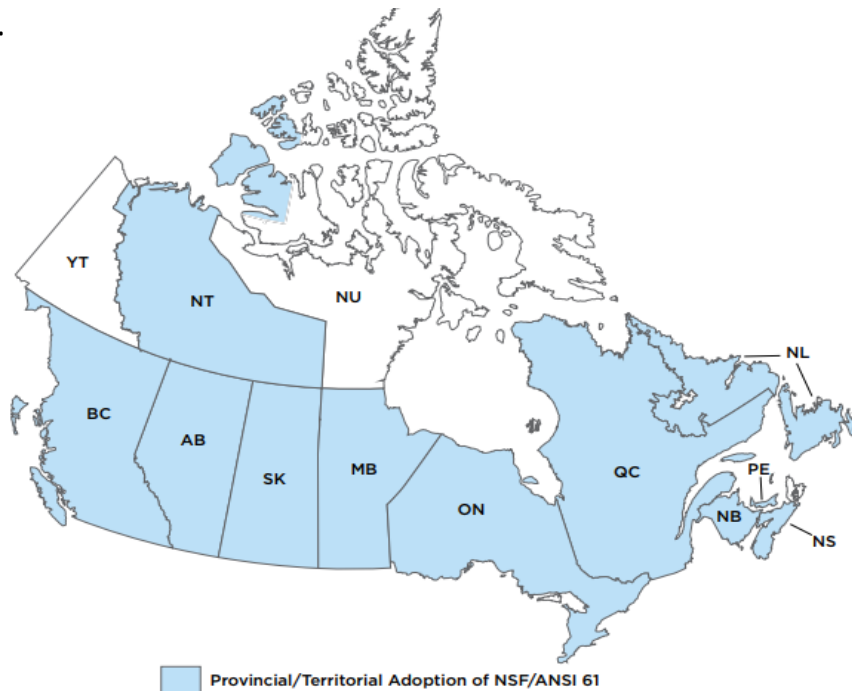

NSF / ANSI 61 impacts the manufacture and sale of water treatment or distribution products in North America. Products are required to comply with NSF/ANSI 61 by most State and Provinces for drinking water supplies and construction.

NSF 61 Categories

- Pipes and related products (pipe, hose, fittings)
- Protective barrier materials (cements, paints, coatings)
- **Joining and sealing materials (gaskets, adhesives, lubricants)**
- Process media (filter media, ion exchange resins)
- Mechanical devices (water meters, valves, filters)
- Plumbing devices (faucets, drinking fountains)

NSF/ANSI 61 in the Canada

Canada is similar to the United States in that drinking water distribution systems are typically required by the plumbing code. All ten provinces and the Northwest Territories have requirements for water distribution systems to comply with NSF / ANSI 61

LINK-SEAL® Model S61™ Applications

Required : Direct contact with the drinking water supply / distribution

- Water tanks / towers.
- Water treatment facilities.
- Pump stations

Often Preferred / Suggested

- Food manufacturing facilities
- Medical / pharmaceutical manufacturing facilities
- Breweries / distilleries / bottling facilities

LINK-SEAL® Model S61™ Thoughts

Feedback from LINK-SEAL® distributors

- NSF 61 is required in most states and provinces these days, but the knowledge of NSF 61 requirements are not always reflected in the specs and designs.
- As suppliers / distributors we need to ask questions on orders from customers in the water / waste water market to ensure we are supplying the correct product to effectively solution the situation.
 - **Is any application on this project for water sanitation or drinking water distribution?**
 - **Will LINK-SEAL® be in direct contact with food or drinking water?**
 - **Is NSF 61 certified product required?**
